"A Process for Preparing Sulfuric Acid"

USSR Author's Certificate No 289821, filed 6 Jan 69, published 5 Sep 72,
(from Referativnyy Zhurnal -- Khimiya, No 8(II), 1973, Abstract No 8L262P)

Translation: A process is patented for repairing H_2SO_4 by the electrolysis of an aqueous solution of metal sulfates, during the depolarization of the anode by a sulfur gas in the presence of a catalyst in the electrolyte. This process is improved in that to increase the degree of utilization of the sulfur dioxide and to decrease the anode potential to increase the yield of the final product, a soluble halide salt is added to the electrolyte as a catalyst which is preferential for the cation, similar to the cation of the electrolyte. The catalyst is added in concentrations of 0.1 to 50 grams/liter. The process is carried out for a D_a of 500 to 3,000 amps/m² and at an electrolyte temperature of 20-90°. For example, the electrochemical processing of Na_2SO_4 , the electrolysis is carried out in a three chamber electrolysis apparatus with 1/2

an iron (wire-gauze) cathode and a hollow graphite anode with a porosity of 33%. The initial electrolyte (Na_2SO_4) is added to a concentration of 290/ grams/liter in the middle compartment of the apparatus. To the electrolyte is added 0.56 grams/liter of NaCl. The sulfur dioxide evolves under a pressure of 150 mm of mercury in the hollow part of the anode and it migrates through the pores of the graphite to the anolyte. The process goes at temperatures of the original electrolyte of 60° , and a charge on the electrolytic apparatus of 5 amps and D_a of 1000 amps/m². It was determined that the anode potential was 1.15 volts and the efficiency of the utilization of the sulfur gas was 75-80%.

SSSR, Moscow, Institut Fiziki). Translation of Russian Pre-
print No. 104. 22p. (NASA-CR-105625). CFSTI.

A number of new experimental data have recently become available on the spectrum of the solar corona in the x-ray region (1 to 30 Å). In this paper, the spectrum is theoretically calculated with a number of refinements compared to previous computations. Specifically, dielectronic recombination and photorecombination on all levels were taken into consideration in calculating the ionization equilibrium. A computer was used for determining the effective cross sections of excitation, ionization, dielectronic recombination and photorecombination necessary for calculating population intensities. "A Maximin Set and Algorithm for its Construction"

V sb. Nekotor. vopr. prikl. mat. (Some Problems of Applied Mathematics--
collection of works), vyp. 5, Kiev, 1971, pp 175-177 (from RZh-Kibernetika,
No 1, Jan 72, Abstract No 1V763)

Translation: The author introduces the concept of a maximin set for the
first player in an antagonistic game.. A criterion is presented for the
maximin property of a set, and a certain algorithm is described for find-
ing it in the case where the set of pure strategies for this player is
finite. It should be mentioned that the exposition is not sufficiently
clear, and that some of the notation is inaccurate. I. Fokin.

EEYKO, I.V., Dopovidи Akademii Nauk Ukrains'кої RSR, Seriya A -- Fizyko-Tekhnichni ta Matematychni Nauky, No 11, Nov 70, pp 968-971

The author modifies the method previously suggested by him for finding absorption time \bar{T}^K in the case of the set $K \equiv K_s = \{x, y | x_i = y_i, i=1, \dots, s\}$ and process controls which are described by systems of ordinary differential equations of order n, in which the sets $D_\psi = \{x, y | \psi^*(x-y) = 0, \psi_i = 0, i > s\}$ were selected as elements of the K-optimal set G. If V(t) is chosen instead of V in the suggested algorithms, B-algorithms are automatically obtained for finding controls which satisfy the necessary conditions for optimality on the basis of max/min time of the K,0-problem. A theorem is derived which permits the formulation of various optimality criteria with respect to the functionals ϕ chosen. It follows from this theorem that the K,0-problem decomposes into two problems

3/4

USSR

BEYKO, I.V., Dopovidi Akademii Nauk Ukrains'koi RSR, Seriya A -- Fizyko-Tekhnichni ta Matematychni Nauky, No 11, Nov 70, pp 968-971.

$$\Phi(P_t B(y^0, \bar{v}, T^K)) = \max_{v \in V(T^K)} \Phi(P_t B(y^0, v, T^K)),$$

and

$$\Phi(P_t A(x^0, \bar{u}, T^K)) = \max_{u \in U} \Phi(P_t A(x^0, u, T^K)),$$

If these two problems satisfy conditions under which the maximum principle is in effect, control u^0 satisfies the maximum principle and control v^0 satisfies the maximum principle with certain phase constraints.

"Possible Creep Mechanism of Multilayer Composite Rings Under Internal Pressure"

Riga, Mekhanika Polimers, No 5, Sep/Oct 73, pp 884-890

Abstract: The deformability of a ring consisting of helically arranged reinforcing layers and a polymeric bonding agent is analyzed. In measuring the dislocations of the external ring surface under the action of an internal pressure, the creep of the material cannot properly be distinguished from the crawling apart of the ring. At prolonged action of internal pressure, under increased pliability conditions of the matrix, the development of additional deformations caused by the crawling of the coils is possible. The analysis of creep deformation effected by this crawling signifies that the elasticity of the rigid reinforcing layer has little effect on the deformations related to the crawling of the ring. Four figures, 24 formulas, seven bibliographic references.

"Coping With Current Health Problems in the RSFSR"

Moscow, Gigiyena i Sanitariya, No 12, 1972, pp 8-16

Abstract: Health problems were a major concern of the communist leaders after the revolution who swiftly organized agencies and services to deal with epidemics and famines. As these were brought under control, health officials became involved in city planning, design and building of houses, etc. The increasing tempo of industrialization led the authorities by the 1930's to study atmospheric pollution and the disposal of municipal and industrial sewage. Water pollution and suitable use of water resources were major interests by the 1940's. Following the war, industrial hygiene and occupational diseases along with food poisonings became the center of attention. In the 1960's research was focused on the problems created by the chemicalization of agriculture, the use of pesticides in particular. The effects of exposure to ultrasound, radiation, microwaves, and other technological advances are now under study. Much stress is placed on preventive medicine, with frequent mass check-ups of the population, particularly children and adolescents. The importance of

"Determining the Effective Masses of Current Carriers in Strongly
Alloyed Semiconductors by the Effect of Conduction Electrons
(Holes) on Elastic Constants"

Leningrad, Fizika i Tekhnika Poluprovodnikov, Vol 4, No 5, 1970,
pp 912-914

Abstract: The effective masses of the density of states of
current carriers m_{eff} in strongly alloyed semiconductors were
determined with respect to the temperature dependence of the
effect of conduction electrons (holes) on semiconductor elastic
constants. m_{eff} are determined for troughs on the <111> and <100>
axes in n-Ge, <100> in n-Si, and <000> in p-Si and p-GaAs.
The accuracy for the determination of m_{eff} is not inferior to the
accuracy for the determination of effective mass in a strongly
alloyed material.

1/2

USSR

BEYLIN, V. N., et al., Fizika i Tekhnika Poluprovodnikov, Vol 4,
No 5, 1970, pp 912-914

The most accurate direct method of determining effective mass -- the method of cyclotron resonance -- is inapplicable to strongly alloyed semiconductors (the condition of $m^*/m \approx 1$ required for resonance is not satisfied), and masses are usually determined by methods having low accuracy. For this reason it is of interest to investigate the possibility of determining m^* by elastic constant data. The author's method permits sensing of variation of m^* in the presence of strong alloying caused by the nonparabolic nature of the bands (p-GaAs, p-Si), and it also permits determination of effective masses in upper systems of minima. Applicability of the method is limited to substances in which the effect of conduction electrons (holes) on the elastic constant is observed. Values of effective masses are tabulated for germanium, silicon and gallium arsenide.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE EFFECTIVE MASSES OF THE DENSITY OF STATES OF CURRENT CARRIERS M SEXTILE SUBD IN STRONGLY ALLOYED SEMICONDUCTORS WERE DETERMINED WITH RESPECT TO THE TEMPERATURE DEPENDENCE OF THE EFFECT OF CONDUCTION ELECTRONS (HOLES) ON SEMICONDUCTOR ELASTIC CONSTANTS. M SEXTILE SUBD ARE DETERMINED FOR TROUGHS ON THE (111) AND (100) AXES IN N-GE, (100) IN N-SI, AND (000) IN P-SI AND P-GAAS. THE ACCURACY FOR THE DETERMINATION OF M SEXTILE SUBD IS NOT INFERIOR TO THE ACCURACY FOR THE DETERMINATION OF EFFECTIVE MASS IN A STRONGLY ALLOYED MATERIAL. THE MOST ACCURATE DIRECT METHOD OF DETERMINING EFFECTIVE MASS, THE METHOD OF CYCLOTRON RESONANCE, IS INAPPLICABLE TO STRONGLY ALLOYED SEMICONDUCTORS (THE CONDITION OF ST 1 REQUIRED FOR RESONANCE IS NOT SATISFIED), AND MASSES ARE USUALLY DETERMINED BY METHODS HAVING LOW ACCURACY. FOR THIS REASON IT IS OF INTEREST TO INVESTIGATE THE POSSIBILITY OF DETERMINING M SEXTILE BY ELASTIC CONSTANT DATA. THE AUTHOR'S METHOD PERMITS SENSING OF VARIATION OF M SEXTILE SUBD IN THE PRESENCE OF STRONG ALLOYING CAUSED BY THE NONPARABOLIC NATURE OF THE BANDS (P-GAAS, P-SI), AND IT ALSO PERMITS DETERMINATION OF EFFECTIVE MASSES IN UPPER SYSTEMS OF MINIMA. APPLICABILITY OF THE METHOD IS LIMITED TO SUBSTANCES IN WHICH THE EFFECT OF CONDUCTION ELECTRONS (HOLES) ON THE ELASTIC CONSTANT IS OBSERVED. VALUES OF EFFECTIVE MASSES ARE TABULATED FOR GERMANIUM, SILICON AND GALLIUM ARSENIDE. FACILITY: INSTITUTE OF STEEL AND ALLOYA, MOSCOW.

106494r Technical inhibitors of the acid corrosion of steel studied from electrocapillary curves. Afanas'ev, A. S.; Bel-

inova, L. A.; Malysheva, T. V. (Dnepropetrovsk. Met. Inst., Dnepropetrovsk, USSR). Zashch. Metal. 1970, 6(1), 84-6

(Russ). The relation between the adsorption of surfactants on Hg and their inhibiting action on low-C steel was studied from electrocapillary curves plotted with an Hg electrometer in 20% H₂SO₄ at 25 ± 1° in the range 50-100 mV. The inhibitors were used in amts. of 0.2 wt. %. The type of adsorbed particle was detd. by the max. potential with ($\varphi_{m,i}$) and without ($\varphi_{m,0}$) inhibitors. Cathodic additives gave $\varphi_{m,i} - \varphi_{m,0} = \Delta\varphi_m > 0$ and anodic additives gave $-\Delta\varphi_m < 0$. The stability of adsorption was detd. by the potential at the junction of the branches of electrocapillary curves plotted with and without additives. This corresponds approx. to the potential of desorption φ_{des} . Additives having $\varphi_{des} > +0.5V$ were designated as Type I and those with $\varphi_{des} = 0.34-0.44V$, as Type II. For both types there was a relation between the coeff. of corrosion inhibition (γ) and the value $\Delta\varphi_m$. Between $\Delta\varphi_m < 0.2V$ and $\Delta\varphi_m > 0.2V$, the value of γ changed sharply. A parallel was observed between adsorption on Hg and protective effect. The value of γ for Type I cationic surfactant was greater than that for Type II. Surface activity

1/2

REEL/FRAME
19801163

AP0049346

is important but is not the only factor in protective activity so that γ does not depend directly on surface tension. Type I inhibitors are adsorbed due to interaction of π atoms in their aromatic rings with Hg surface and also to the adsorption of Cl^- and Br^- ions on the Hg surface which act as "anionic bridges" for the adsorption of org. cations. Type II inhibitors do not contain halogen ions and thus are only adsorbed by the former mechanism. Addn. of KBr increases γ for a Type II inhibitor, changing it to a Type I.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE UNSTEADY STATE PROBLEM OF THE DEVELOPMENT OF A CATHODE SPOT IS SOLVED BY USING THE MODEL SUGGESTED EARLIER (1969), IN WHICH THE IONIC CURRENT IS DETERMINED MAINLY BY THE DIFFUSION OF IONS WHICH ENTER FROM THE REGION OF IGNITION. THUS, THE UNSTEADY STATE CHANGE IN THE FRACTION OF THE IONIC CURRENT IS DETERMINED. BY SOLVING THE UNSTEADY STATE DIFFUSION EQUATION FOR THE CONDITIONS THAT THERE IS A SOURCE OF IONS WHICH RESULTS FROM THE IGNITION OF NEUTRAL ATOMS BY ELECTRONS EMITTED FROM THE CATHODE. THE CALCULATIONS SHOW THAT THE THERMAL FIELD EMISSION ELECTRON SPOT CAN EXIST ON A HEATED SURFACE ONLY FOR A LOW VALUE OF THE ELECTRON CURRENT FRACTION (0.5-0.7), BECAUSE A HIGH SURFACE TEMP. CAN BE MAINTAINED ONLY BY THE IONIC COMPONENT OF THE CURRENT.

"Study on the Light Sensitivity and Fungicidal Properties of
Silver Complexes"

Leningrad, Zhurnal prikladnoy Khimii, Vol 64, No 10, Oct 71,
pp 2311-2316

Abstract: Dense shielding of a silver ion by various ligands without reducing properties makes it possible to obtain photo-stable complexes. This study concerns the quantitative aspects of the light sensitivity, thermal stability, and the fungicidal properties of a number of silver compounds with high light sensitivity. The highest light resistance (1 year+) was shown by tris-1,10-phenanthroline perchlorate. The high light resistance is attributed to the dense shielding of the silver ion by three large ligand molecules which hinder the charge transfer to Ag+ from outer-sphere ions as well as to the low electron donor capacity of the outer-sphere perchlorate ion. It is noteworthy that 1/2

USSR .

KUZNETSOV, A. YA., et al, Zhurnal prikladnoy Khimii, Vol 64,
No 10, Oct 71, pp 2311-2316

high light resistance is typical of thermally stable compounds. Bis-2,2'-bipyridylsilver nitrate was the only compound to pass the standard tests for biological activity (15 days). Silver complexes with 1,10-phenanthroline and ethylenethiourea also show promise with regard to both light resistance and biological activity. These compounds must be used in the form of nitrates or perchlorates with a co-ordination-saturated inner sphere. Test data on the light resistance and biological activity of complex silver compounds, their formulas, ligands, complex concentration in solution and test durations are given.

"Diurnal Rhythm of Wakefulness and Sleep in Narcolepsy"

Moscow, Byulleten' Eksperimental'noy Biologii i Meditsiny, Vol 71, No 3, Mar 71, pp 20-23

Abstract: The diurnal rhythm of wakefulness and sleep was studied in one patient with monosymptomatic narcolepsy (attacks of sleep during daytime) and in two patients with polysymptomatic narcolepsy (sleep attacks, cataplexy phases, and hallucinations during night sleep). Electroencephalograms (frontal, parietal, and occipital areas), electromyograms (mouth musculature), and electrocardiograms were recorded while the patients were carefully observed over a 24-hour period. The total duration of the sleep phase was markedly prolonged in the patient with monosymptomatic narcolepsy as a result of the sleep seizures during the day. Stages of pronounced drowsiness were observed in the patients with polysymptomatic narcolepsy. All patients 1/2

displayed a deficit of the various "slow" sleep phases and increased recurrence of "rapid" sleep phases in the first half of the day and of delta-sleep phases in the evening and at night. A premature onset and a greater phasic activity of "rapid" sleep was observed in patients with polysymptomatic narcolepsy.

"Manufacture of Large Mirrors of Polymers by the Copying Method"

Optiko-mekhanicheskaya Promyshlennost', No 10, 1971, pp 41-44.

BSTRACT: A method is described for manufacture of spherical mirrors 700 mm in diameter of a polyester resin, using silumin as a base. The cost of these mirrors is significantly lower than similar glass mirrors. The copying method used is quite straight forward, involving production of a master reversed shape by casting of polyester on an optical glass mirror, after which the reversed shape master is used to produce polyester mirrors of the proper shape. A photograph is presented of the casting table used for production of the mirrors.

Nucleons"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya, Vol. 36,
No. 8, Aug 72, pp 1626-1631

Abstract: Experimental data obtained at the Kum-Bel' High-Altitude
Station of the Physicotechnical Institute of the Academy of Sciences
Uzbek SSR are reported. The station is 3200 m above sea level. The
setup contains three series of wide-gap spark chambers with effective
areas of 2 m^2 placed above and below the target. The Čerenkov spectro-
meter with total absorption and an ionization calorimeter with an area of
 10 m^2 were used to measure the primary energy E_0 . Up to the present time
experimental data obtained over 630 hours of operation of the device have
been processed, with a high-voltage pulse being supplied to the electrodes of
the spark chambers. Showers with an energy of $> 200 \text{ GeV}$ generated in the target
were selected for analysis. The following ratio was obtained for the number
1/2

Vol 36, No 8, Aug 72, pp 1626-1631

of primary charged N_c and neutral N_n particles: $N_c/N_n = 2.3 \pm 0.3$; this shows that the proportion of charged particles is ~34% of all nuclear active particles, thus making it possible to study pion-nuclear collisions by comparing the characteristics of the interaction of charged and neutral primary particles. A weak functional dependence between the inelasticity coefficient $\langle k_{\gamma} \rangle$ and the atomic number of the target nucleus and a strong functional dependence between this coefficient and the nature of the primary particles were obtained for interactions of hadron with $E_0 > 200$ GeV. $\langle n_s \rangle$ is almost a logarithmic function of E_0 . The average multiplicity in the interaction of pions with neutrons in paraffin is identical within the experimental limit. A considerable azimuthal effect was observed for the angular distribution of secondary particles. The azimuthal effect has its greatest value for showers with $n_s = 8-15$, or a multiplicity close to average.

"Study of Characteristics of Inelastic Interactions of Cosmic-Ray Particles
in the 10^{11} to 10^{12} -ev Energy Range"

Moscow, Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya, Vol 35, No 10,
Oct 71, pp 2065-2068

Abstract: Experiments that were performed at the high-altitude test station
(3,200 m.) at Kum-Bel' in Uzbekistan are described. The purpose of the experiments was to investigate the angle of arrival and the energy characteristics of interactions of pions and nucleons with light and heavy nuclei at 2×10^{11} to 2×10^{12} ev and the mechanism of generating muons at energies above 2×10^{12} ev. Equipment consisted of spark chambers, located above and below the target (paraffin wax, carbon, and iron), a Cerenkov spectrometer of full absorption, and an ionization calorimeter. This complex method of measurements was found convenient for use in various modes of operation. A detailed description of various parts of the installation and their disposition is given in the paper.

- 123 -

USSR

ABULLAYEV, A. M., et al., Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya, Vol 35, No 10, Oct 71, pp 2065-2068

Joint operation of ionizing calorimeters and spark chambers is normally difficult because of the need for high voltage on the calorimeter electrodes, combined with the time lag of the input pulse from the spark chambers, amounting to over 20 microseconds. This difficulty was avoided in the present experiments by storing pulses in memory cells, with the subsequent input of a high-voltage pulse of about 120 kv. Operation was controlled by a master-pulse, prior to which all parts of the equipment were kept inoperative.

Results of 200 hours of the joint operation of a Cerenkov spectrometer and ionizing calorimeter, with graphite used as the target, have been processed so far. For analysis, showers with energy above 1.5×10^{11} ev were selected, 130 of them having been observed. The ratio of charged to neutral nucleons were determined and, from it, the fraction of charged pions of the total nucleus-active stream of particles. The inelastic coefficient for the formation of π^0 -mesons was computed from the experiments related to the interaction of neutral particles with nuclei of graphite.

It is concluded that the combination of ionizing calorimeter with Cerenkov spectrometer of full absorption for the simultaneous determination of energy of primary particles made it possible to determine the fraction of 2/3

USSR

ABULLAYEV, A. M., et al., Izvestiya Akademii Nauk SSSR, Seriya Fizicheskaya, Vol 35, No 10, Oct 71, pp 2065-2068

energy supplied by the ionizing particles π , since a Cerenkov spectrometer measures only the energy emitted by relativistic particles. It was found that for the mean energy of primary particles of 350 Gev the energy part lost on nuclear fissions in the spectrometer, with CCl_4 as the light emitter, is $\eta = 0.25$,

Frunze, Izvestiya Akademii Nauk Kirgizskoy SSR, No 4, Jul-Aug 73, pp 47-49

Abstract: Reaction of monosubstituted amyl- and benzylpiperazines with phosphonic acid dichlorides and phenylamidophosphoric acid chloride in presence of dry triethylamine yields novel amidophosphonates and amidophosphates. All of the amidophosphonates are crystalline products; the di(1-amylpiperazinyl-4)phenylamidophosphate is an oily product which can be isolated by conversion to a picrate. Another possible synthetic method for amidophosphates is based on the reaction of monoamylpiperazine with dialkyl(aryl)phosphoric acid chlorides in benzene and in presence of dry triethylamine.

Abstract: In a continuing search for physiologically active phenothiazine derivatives, a study was made of the reaction of 10-(2,3-epoxypropyl)phenothiazine with β -alkoxyvinylphosphonic anhydrides, thio- and dithioanhydrides. A series of previously unknown crystalline heterocyclic esters were prepared by the cited reaction. The reaction with thioanhydrides gave the esters with a 1,2,3-oxaphosphathiazole ring structure, as indicated by their IR spectra. The yields, mp, and elemental analysis data of the products are tabulated and their preparation is described.

"Phosphorus-containing Phenothiazine Derivatives"

Leningrad, Zhurnal Obshchey Khimii, Vol 41, No 1, Jan 71, pp 110-114

Abstract: In searching for physiologically active substances the authors synthesized previously unknown phosphates, phosphonates and thiophosphonates of phenothiazine derivatives with residues of phosphorus acids bonded to the nitrogen atom of the phenothiazine nucleus by a hydrocarbon chain. [β -(Pheno-thiazinyl-10) isopropyl] phosphates were obtained by the reaction of chloro-phosphates with 10-(β -hydroxypropyl)phenothiazine. Bis[β -(phenothiazinyl-10)isopropyl] methylphosphonate was obtained from methylphosphonic acid dichloride and 10-(β -hydroxypropyl)phenothiazine. [β -(Pheno-thiazinyl-10) isopropyl] diethylthiophosphinate was obtained from the diethylamide of diethylphosphinous acid and 10-(β -hydroxypropyl)phenothiazine with subsequent addition of sulfur to the phosphinite. Sodium phenothiazine reacts with diethyl esters of chloromethyl- and β -chloroethylphosphonic acids to give N-ethylphenothiazine and diethyl [β -(phenothiazinyl-10)ethyl] phosphonate respectively. The oxidation of [β -(phenothiazinyl-10)isopropyl] phosphates was studied.

"Results of Mass Vaccinations against Zoonotic Cutaneous Leishmaniasis"

Moscow, Meditsinskaya Parazitologiya i Parazitarnyye Bolezni, Vol 39, No 5, Sep/Oct 70, pp 541-551

Abstract: Preventive mass vaccinations with a virulent strain of Leishmania tropica major were found to give reliable protection against cutaneous leishmaniasis. Only virulent strains can be used for vaccination. The degree of inoculation with such strains is almost 100%, the inoculative process having, as a rule, a favorable effect. The maximum size of the vaccination lesion does not exceed 2 cm in diameter in 3/4 of the subjects vaccinated. In practically all cases, the process does not last more than 5-6 months. Morbidity occurred in the group vaccinated with the low-virulence strain, among those without lesions, and among those whose lesions were less than 0.5 cm in diameter.

SERGIYEV, P. G., et al., Meditsinskaya Parazitologiya i Parazitarnyye Bolezni,
Vol 39, No 5, Sep/Oct 70, pp 541-551

Secondary pyococcal infections represented the only complications observed; allergic exanthem was noted occasionally. In order to prevent local and general allergic reactions after vaccination, it is necessary to exclude persons who have had cutaneous leishmaniasis. If past disease cannot be revealed by means of anamnesis or medical examination, the intracutaneous leishmanin test is recommended. The level of the virulence in inoculative strains should be periodically tested, since insignificant initial virulence or its weakening during culturing make a given strain unfit for preparation of inoculum.

"Concerning the Content and Methods of Temperance Propaganda"

Moscow, Zdravookhraneniye Rossiyskoy Federatsii, No 5, 1970, pp 16-19

Abstract: The desiderata and shortcomings of educational campaigns dealing with alcoholism are discussed, with critical reference to several authors in the field. Drunkenness, a social phenomenon, and alcoholism, a true disease must be distinguished. The lack of systematic efforts and a scientific approach to alcoholism are deplored. The need for evaluating the effectiveness of treating alcoholism is urged. Scientific indices by which to measure the effectiveness are the number of alcoholics asking for help, and the percentage of relapses. The need for a broad educational campaign that is accurate and scientific as well as comprehensible to the public is emphasized. The need for winning over the public, for establishing a positive relationship with it, is also stressed. Avoidance of extreme, unrealistic, unconvincing slogans is recommended. The danger of regular use of alcohol as a possible cause of alcoholism is pointed out. An all-out campaign to stop completely the use of alcohol is considered unrealistic. Cooperation of medical and administrative personnel of various enterprises is urged.

"Effective Efficiency of Heating a Part by a Welding Arc When Working in the Wind"

Moscow, Svarochnoye Proizvodstvo, No 10, Oct 70, pp 2-3

Abstract: A method is presented for studying the effective efficiency of heating a part by a welded arc subject to the influence of wind during manual welding using type UONI-13/45 electrodes 4 mm in diameter and semi-automatic welding in CO₂ using PP-Yu8 wire. The quantity of heat introduced to the specimen was determined by calorimetry, after which the effective efficiency of heating of the product was calculated using formulas presented in the work. The effective efficiency of heating in winds up to 7 m/sec decreases by an average of 3-5% for T-welding and 6-10% for butt welding. Welding in a medium of CO₂ produces a somewhat higher effective efficiency of heating.

BIOCHEMICAL, PHYSIOLOGICAL AND MORPHOLOGICAL CHARACTERISTICS
OF CONTINUOUS CULTURE OF A LYSINE PRODUCER.

G.Verina, N.Buklisa, S.Selca, A.Alexandrova, A.Bezborodov,

G14-14

The August Kirchenstein Institute of Microbiology
Latvian Academy of Sciences, Riga, Latvia, USSR

Kinetics of L-lysine biosynthesis by the auxotrophic mutant
Proteobacterium sp. was studied. The experiments were performed in
a complex (molasses-maize) medium balanced with the help of retutable
method of the medium basic ingredients planning. The continuous
fermentation was realized in accordance with chemostat principle;
molasses concentration (S) and aeration intensity (FO_2) were used
as growth limiting factors.

It was found that the cellular RNA content is in ordinal relation
to the growth rate (μ) and the medium growth limiting factor.
Protein and DNA content in the biomass are more stable. At higher
growth rate the constructive metabolism and catabolic processes in
a cell increase. Close correlation is stated between the L-lysine
biosynthesis and citrate dehydrogenase, lactate dehydrogenase and
total reductive activity of cells.

Morphologic changes of cells in various conditions of cultivating
were studied by the electronic microscopy method.
The continuous L-lysine biosynthesis process kinetics has
shown that the values of the specific growth rate, specific lysine
biosynthesis ability, metabolism coefficients, economic coefficients
and culture productivity depend on the flow rate and the growth
limitation.

An ability of different representatives of fungi to synthesize alkaloids under the submerged and surface culturing was studied. Two kinds of media were used for the growth of fungi: (a) synthetic medium, containing mannite and succinic acid as the carbon source; (b) complex one with corn-steep extract, peptone and glucose.

Medium and mycelium were subjected to an analysis for alkaloid content. Mycelium was homogenized. Then alkalorescence and extraction by the chloroform-isobutanol mixture (4:1) were carried out. After that alkaloids were transferred into an aqueous solution by acidification with sulphuric acid. The procedure was repeated twice. Further an analysis was carried out.

Qualitative alkaloid content tests were put with 6 reagents typical of alkaloids and close related to them compounds. As the result it was stated that 27 strains of 103 ones examined belonging to Penicillium, Aspergillus, Fusarium, gave all the 6 reactions, 1 gave 5 positive reactions and 29 did 3.

Most of extract didn't give colorimetric reaction typical of indole derivatives. Chemical nature of compounds obtained is under investigation.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. A STUDY ON THE CONDITIONS FOR GROWTH OF SERRATIA MARCESCENS 42 AND FOR BIOSYNTHESIS OF UBIQUINONE,8 AND VITAMIN K SUB2 (40) HAS SHOWN THAT OPTIMAL VALUES OF PH FOR FERMENTATION WERE 7.0-9.0. POOR GROWTH OF THE CULTURE AND LOW PRODUCTION OF VITAMIN K SUB2 (40) WERE REGISTERED AT PH 3.0. THE HIGHEST YIELD OF BIOMASS, Q,8 AND VITAMIN K SUB2 (40) WAS FOUND DURING THE STATIONARY PHASE OF GROWTH (THE 2-30 DAYS) WHEN THE MAIN COMPONENTS OF THE MEDIUM HAVE BEEN CONSUMED. CHANGES IN THE CONCENTRATION OF GLUCOSE AND AMMONIUM PHOSPHATE IN THE MEDIUM AFFECTED GROWTH OF THE CULTURE BUT EXHIBITED ALMOST NO EFFECT UPON BIOSYNTHESIS OF Q,8 AND VITAMIN K SUB2(40). MEDIA CONTAINING GLUTAMIC ACID (20-50 G-L) STIMULATED MAXIMAL ACCUMULATION OF BIOMASS AND ITS HIGH PRODUCTIVITY WITH RESPECT TO Q,8 AND VITAMIN K SUB2(40). NO CORRELATION WAS ESTABLISHED BETWEEN CHANGES IN THE RATIO VITAMIN K SUB2(40)-Q,8 AND COMPOSITION OF THE MEDIA OR THE GROWTH PHASE OF THE CULTURE. THE RATIO OF CONCENTRATIONS K SUB2-Q,8 WAS 20-50PERCENT IN DIFFERENT EXPERIMENTS.

A RECENT
BRIEFING
RESEARCH

The ability of Penicillium fungi to release extracellular RNases with optimum pH in glutacic medium has been established.

The extracellular RNase of Penicillium brevicompactum has been purified to homogeneous state. Optimum pH, specificity, mode of action on native substrates, stability, thermostability, influence of SH-reagents and urea have been examined as well as inhibition by products of reaction and by their analogues.

pH-dependence of kinetic parameters of transferase and hydrolase steps of reaction has been determined using low molecular weight substrates (C₄p, U₄p, ApAp and C₄t).

The amino acid composition of the enzyme has been studied and the effect of carboxymethylation, photooxidation and chemical reduction on the enzyme activity has been investigated.

On the basis of data obtained one may draw a conclusion that Pen. brevicompactum RNase is similar to Mycelium B₂ of Aspergillus oryzae and to RNase I of Pen. italicum. Histidine residue and carboxylic group appear to be in the active site of the enzyme.

"Extracellular Phosphomonoesterases Produced by Fusarium"

Moscow, Mikrobiologiya, Vol 39, No 5, Sep/Oct 70, pp 741-747

Abstract: Nine of 13 fungi of the genus *Fusarium* released both acid and alkaline phosphomonoesterases (PME's) into the culture fluid of a complex medium. *Fusarium virio* did not release PME and *F. solani* released only a small amount. Acid PME's predominated in all of the fluids investigated. Optimum pH, thermostability, and the effect of various substances (including bivalent metals) on *F. oxysporum* and *F. sonstictum* PME were studied. Acid PME's had an optimum pH of 5.2; 7.0 was the optimum pH for alkaline PME's of *F. oxysporum*. The PME's were thermolabile at pH value from 2.8 to 9.0. The acid PME's were not inhibited by EDTA or citrate; the alkaline PME's were. Phosphate inhibited the activity of both acid and alkaline PME's. Cobalt, calcium, and magnesium activated the PME of *F. oxysporum* to a higher degree than that of *F. sonstictum*. The extracellular alkaline PME of *F. oxysporum* was inhibited by inorganic phosphate ions; the acid PME was not. Most of the investigated cultures of the genus *Fusarium* thus produce and release acid and alkaline PME's into the culture fluid. The acid PME's appear earlier and in larger quantities than do the alkaline PME's.

" $\text{Cd}_x\text{Hg}_{1-x}\text{Se}$ Photosensitivity Spectra"

Leningrad, Fizika i tekhnika poluprovodnikov, No 10, 1972, pp 2045-2047

Abstract: This brief communication provides the results of experiments designed to investigate the photosensitivity spectra of $\text{Cd}_x\text{Hg}_{1-x}\text{Se}$ compounds made by the Bridgman method in a vertical oven. Formation of the solid solutions of cubic structure for values of x up to 0.8 was roentgenographically confirmed, and the measurements made were subject to an average error of $\pm 2.5\%$. A description of the preparation procedure for the specimens is given; their photosensitivity spectra were obtained with a device using the IKS-21 spectrometer, narrow-band amplifier U-2-6, and synchronous detector SD-1. The spectra were shifted to the long-wave side with increasing mercury content of the solution; at the same time, the bandwidth increased and the photosensitivity dropped with increasing shadow conductivity. Curves are plotted for the maximum spectral distribution energy as a function of the specimen composition at 77°K , and for other obtained results.

News

Session of the All-Union Astronomical and Geodetic Society

More than 120 representatives of Section of the VAG (All-Union Astronomical and Geodetic Society) met in Moscow in February 1970. A regular plenary session of the VAG Central Committee was held.

In addition to the traditional general session devoted to the comprehensive report of the Central Committee and its discussion, there sessions were in session: meteorological, geodetic and structural-mathematical, as well as sessions of a group of investigators of noctilucent clouds.

The plenary session heard reports by M. A. Arfikis and V. P. Tsevich on the work of the Lithuanian and Odessa Divisions of the VAG. In the reports and during the discussions much attention was given to people's observations of planes made available for people's observations, but incomplete funds are available for their construction, and most importantly, funds for people to acquire telescopes. It is true that in Moscow, at the Vag and some other cities amateur astronomers are fabricating binoculars, reflecting telescopes, but in insufficient numbers, and therefore the material organization of telescopes for people's observations is at present fails.

Reports of V.A. Kondratenko are already required to go with plans for people's astronomical clubs, as under the direction of I. M. Bezchastnov (see Zvezdochnoye Delo, No. 2, 1965, p. 75.)

At the plenary session a report was given by P. M. Arinov, director of observatory, Ovchino village, Moscow oblast, where he is in charge of the construction of a 50-cm telescope (designed by P. M. Arinov and I. M. Arinova). In this, a large plan was laid for building a larger telescope.

*DPR 51452
J. B. B.*

Philosophical problems in astronomy were discussed in reports by V. V. Karginov, N. S. Sodakov and K. A. Portsevskiy told about the perspectives of the VAGD in relation to the 100th anniversary of the birth of Vladimir Ilich Lenin.

B. Ya. Savtsev, president of the VAGD, reviewed recent data on Venus and Mars. He attributed the high surface temperature of Venus to a singular greenhouse effect in its atmosphere and exhibited beautiful color slides of the planet's surface. (V. P. Latrov, together with V. N. Gerasimov, gave a report entitled "Photographing of the Moon and Earth from Astronomical Stations." This was an exceptionally interesting and instructive analysis of excellent color photographs of the moon and our planet.)

These presentations in the plenary session attractively heard a report by V. P. Tserov on the objectives of scientific research work in the field of solid-state electronics.

(An article based on this report will be published in Zemlya i Vremya [Earth and Time].)

The interests of amateur astronomers were reflected in the work of the astronomical section. A report by V. A. Grenzen, read by V. G. Poltava, was devoted to the results of the first "Meeting of young astronomers," held in the summer of 1976 at Shernihina (Gazpromaz SSSR). The observations made on the most interesting meteor showers were discussed by V. P. Tserovitch, V. A. Kostylev and V. V. Prokof'ev.

At the conclusion of the theoretical-orthodoxological section the sections held a friendly discussion of heresy in the schools. Many of the speakers called for the introduction of strict censorship of books to meet the requirements of the Ministry of Education. The heretical student, it was agreed, must be given a choice between the traditional method of punishment or a choice of teacher. (Another V. P. Tsvetkov, which has long been a problem.)

The activities of the Organizational Committee for the fifth congress of the USSR, held in Sept. 1976 in Kazan', was announced at the plenary session and members were invited to full VAGD members.

Following the plenary session, its participants took excursions around the city and visited the central cultural facilities of the participants, including the Central Observatory, section of the Gidrogeofizicheskii Institute (Geophysical Institute). The plenary session participants visited the Museum of the Great Patriotic War and the Kremlin. (The plenary session of the Central Committee of the CPSU, October 1976, p. 11; V. P. Tserovitch, "The Fifth Congress of the USSR," Soviet Astronomer, No. 4, 1976, pp. 71-72.)

"The Role of Analysors of Conditioned and Unconditioned Stimuli in the Functional System of a Conditioned Behavioral Act"

Moscow, Zhurnal Vysshey Nervnoy Deyatel'nosti imeni I. P. Pavlov, Vol 23, No 1, Jan/Feb 73, pp 15-23

Abstract: Formation of a conditioned reflex is based not just on generalization and transformation of evoked potentials to light (used as the conditioning signal) but on the fact that the responses to the conditioning signal in the visual and somatosensory areas in the cortex become synchronous and identical in their configuration with the reactions initially occurring in response to the reinforcing electrocutaneous stimulation. The crucial aspect of this development is reached when, as a result of the training, the latent period of the evoked potentials coincides with the latent period of the motor reaction. Processes taking place during that interval do not occur in succession following recruitment of the individual structures along the reflex arc. Rather, the evoked potentials represent simultaneous activation of all structures in the visual and somesthetic cortex participating in the analysis and synthesis of afferent stimuli and in the process of making a decision and inducing the conditioned behavioral act.

"The Effect of Migration and Other Factors on the Intensity of the Course of the
Epidemic Process"

Moscow, Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii, No 7, Jul 70,
pp 5-8

Abstract: In a continuation of a discussion of the epidemic process begun in an earlier article published in this journal (1969, No. 2), the authors cite a variety of statistics on some of the factors that are increasing the incidence of infectious diseases and the likelihood of epidemics. Not only travel between countries but also migration within countries in assuming enormous proportions. For example, the number of people transported by railroads in 1966 increased from 248,500,000 in 1913 to 2,450,400,000 in 1966. Automobiles carried 2,048,900,000,000 persons in 1966 (as compared to none in 1913). Intraurban traffic and daily commuting are also adverse factors. For example, persons under 30 who spend more than one hour a day commuting are absent from work because of illness 1-1/2 times as often as those living within 30 minutes of their jobs. Crowded housing, vast increases in the number of children attending various institutions, and steady expansion of restaurants add to the potential threat of intestinal, respiratory, and other diseases.

"Prospects for Improving Epidemiological Methods"

Moscow, Zhurnal Mikrobiologii, Epidemiologii i Immunobiologii, No 8, Aug 70,
pp 3-7

Abstract: A mathematical approach to epidemiology, combined with the traditional methods of observation and experimentation, will facilitate the analysis and prognosis of epidemic processes. Models of important infections can be used to forecast the incidence of a disease, carrier state, and changes in the immunological structure of the population, as well as in the gathering and analysis of information to evaluate an epidemic situation. The introduction of computers promises extensive benefits by permitting continuous observation not only of the course of a disease but also of the timeliness, scope, and quality of preventive measures. Before computers can be used effectively, however, the present disorderly flow of epidemiological information must be systematized.

"The Photo-EMF Spectral Distribution in SbSI"

Leningrad, Fizika i tekhnika poluvodnikov, vol 6, No 6, 1972,
pp 1189-1190

Abstract: This brief communication is the consequence of an earlier article authored by some of those named above (Bezdetnyy, N. M., et al, FTT, 13, 1971, p 1242) in which it was shown that the near-surface illumination of SbSI layers using light from the maximum sensitivity region produces a voltage and the flow of short-circuit currents in the external circuit. These are caused by the bend in the zones at the ends of the specimen. In the present communication, the authors investigate the spectral distribution of the photovoltaic output of the SbSI layers after dividing the specimens into two groups depending on the type of bending in the zones at the ends. The spectral distribution of both groups is shown.

"Some Representations for Two-Dimensional Distribution of Stationary Random Processes"

Teoriya veroyatnostev i mat. stat. Mezhved. nauch. sb. (Probability Theory and Mathematical Statistics. Interdepartmental Scientific Collection), 1972, vyp. 6, pp 18-23 (from RZh-Kibernetika, No 9, Sep 72, Abstract No 9V81)

Translation: Let $\{\xi_n\}$ be a random series which is stationary in the narrow sense where each random variable ξ_n assumes the values 0, 1, 2, ..., $m - 1$. For two-dimensional distribution $P_n(i, j) = P\{\xi_0 = i, \xi_n = j\}$, the representation of the following type was obtained:

$$P_n(i, j) = \int_{\frac{i}{m}}^{\frac{i+1}{m}} g_m(m^n x + j/m) df(x) \quad (i = 0, \dots, m-2; j = 0, \dots, m-1)$$

$$P_n(m-1, j) = P\{\xi_0 = j\} - \int_0^{\frac{m}{m}} g_m(m^n x + j/m) df(x) \quad (j = 0, \dots, m-1),$$

"Theoretical, Probabilistic Interpretation of Some Generalized Methods for the Summation of Series"

Visnik Kiiv's'k un-tu. Ser. Matem. ta mekhan. (Bulletin of Kiev University. Series on Mathematics and Mechanics), 1969, No 11, pp 138-142 (from RZh-Matematika, No 3, Mar 1970, Abstract No 3B58)

Translation: A new method for the generalized summation (P-method) is developed and it is shown that consecutive application of the Hausdorff and the P-methods is equivalent to application of the P-method, but with a different probability distribution function. Also, the Hausdorff method is analyzed in its application to the summation of double series.

"An Ultrasonic Defectoscope for the Automatic Monitoring of Large-Diameter Pipes"

Trudy Tbilisskogo Nauchno-Issledovatel'skogo Elektrotekhnicheskogo Instituta (Works of the Tbilisi Electrical Engineering Scientific Research Institute), No 5, 1970, pp 81-85 (from Referativnyy Zhurnal, Metrologiya i Izmeritel'naya Tekhnika, No 7, 1970, Abstract No 7.32.972)

Translation: In the article is described an ultrasonic defectoscope for the automatic monitoring of large-diameter (up to 219 mm) pipes with a wall thickness from 6 to 20 mm, intended for the detection of defects (cracks, pits, foliations, etc.) with dimensions in excess of 2-3 mm. The device has chambers with seeking heads, self-adjusting along the pipe surface; acoustic contact is created by a liquid fed into the chambers, and the defect is registered by an automatic monitor. Note is taken of the high resolving power of the seeking heads, which are provided with
